PROFESSIONAL SUMMARY

Senior QA automation engineer with 8+ years of end-to-end test automation across Australian enterprise case management, B2B manufacturing procurement, regulated financial services, and healthcare. Automation-first across Playwright, Robot Framework, Selenium, and Cucumber, with deep ownership of CI/CD in Azure DevOps and GitLab CI and test management in Jira, Zephyr Scale, and TestRail. Delivers measurable pipeline outcomes: cut a merge-request regression gate from 15.4 to 3.7 minutes, founded a Playwright/TypeScript suite from an empty repository, and maintains 400+ Playwright tests on a live platform. Applies the same reliability discipline to AI automation: designed and runs an AI agent service that takes Jira tickets from Microsoft Teams commands through Claude Code stages (test design, Playwright automation, test runs, reporting) behind human approval gates, completing 418 paired tasks end to end. Also builds open-source AI tools on local LLMs.

TECHNICAL SKILLS

Test Automation: Playwright, Robot Framework, Selenium WebDriver, Cucumber, Cypress (familiar), pytest · Page Object Model, BDD, TDD, data- and keyword-driven testing, fixtures, network interception, API test design

Testing Disciplines: SIT, UAT, end-to-end, regression, integration, smoke, exploratory, manual, API contract, performance (LoadRunner, UFT), security compliance (SOC2)

Test Management: Jira, Zephyr Scale Cloud, TestRail, Azure DevOps Test Plans, HP ALM, Rally

CI/CD & DevOps: Azure DevOps Pipelines, GitLab CI, GitHub Actions, Jenkins, Docker runners · sharding and parallelism, JUnit and HTML report publishing

AI Agents & LLMs: Claude Code (agent instruction files, persistent memory, plan-first workflows), Anthropic Claude API (Python SDK), local LLMs via Ollama, multi-stage agent orchestration, prompt-injection-aware input handling, human approval gates

Integrations & Microsoft 365: REST APIs (Jira, Zephyr Scale, Azure DevOps, GitLab, TestRail, Gmail), webhooks, OAuth 2.0, JWT/token auth, retry and idempotency design · Power Automate, Teams adaptive cards, OneDrive · Postman

Languages & Data: TypeScript, JavaScript / Node.js, Python, Java, PowerShell, Bash, SQL, Gherkin, YAML · SQLite, MySQL, Oracle SQL, Supabase (Postgres) · AWS (EC2, SQS), Sauce Labs, BrowserStack

PROFESSIONAL EXPERIENCE

Senior Quality Assurance Engineer

Hammerjack — Makati City, Philippines *November 2024 – Present* Case Manager platform for Chamsoft Australia (enterprise case management)

Quality engineering

- Own quality across a multi-module enterprise platform (Calendar, Scheduler, Security Groups, Custom Fields, Documents, Digital Signatures, SMS, Email, Reporting API). Delivered 128 user stories (249.5 story points).
- Translated layered requirements into 548 SIT, UAT, and E2E test cases in Zephyr Scale Cloud covering role-based permissions across multiple user tiers. Filed 92 production defects in Jira and drove them to resolution with developers.
- Designed a Playwright framework (UI and API) on Azure DevOps Pipelines with scheduled nightly regression and automated failure alerts to the team channel, giving developers same-morning visibility of overnight breakages.
- Migrated the legacy Robot Framework regression suite to Playwright and maintain 400+ tests across devtest and integration, triaging failures and repairing flaky specs to keep the master regression green.
- Shipped 69 pull requests across two repositories: 37 Robot Framework (Dec 2024 – Mar 2026) and 32 Playwright and product (Mar – Jun 2026), including the pop-out editor cluster and the Scheduler rebuild suite (SCH-3 to SCH-24).
- Built multi-user test patterns for permission-scoped scenarios, including server-timezone-aware appointment seeding and storage-state authentication per role. Contributed integration, SOC2 compliance, and API contract coverage.
- Worked with developers, product managers, and Australian client stakeholders in Agile sprints. Mentored QA teammates on framework usage and Agile testing practices.

AI automation: QA Assistant

- Designed and operate **QA Assistant**, an AI agent service (TypeScript, Node.js, SQLite) running as a Windows service. It orchestrates Claude Code sessions through multi-stage workflows: analyse a Jira ticket, design test cases, create them in Zephyr Scale, capture selectors, generate and run Playwright specs, and post results to Jira. Three human approval gates keep a person in control.
- Made Microsoft Teams its control surface: commands such as `/process`, `/automate`, and `/approve` travel through Power Automate and OneDrive to the service, and adaptive cards return a morning briefing, change checks, and a daily progress report.
- Integrated Jira, Zephyr Scale Cloud, and Azure DevOps: opens draft pull requests, assigns required reviewers, and closes the paired Jira task on merge. 418 paired QA tracking tasks and sub-tasks completed end to end.
- Built to run unattended: SQLite task queue, single-session lock, per-stage timeouts with retry, Jira rate limiting with exponential backoff, catch-up of missed jobs after reboot, and health alerts to Teams.

QA Automation Engineer

Axya — Remote *November 2023 – October 2024* B2B manufacturing procurement SaaS (React 18 / MUI 5 / Django REST), English and French

- Founded the end-to-end suite in an empty repository: 116 spec files and ~346 tests across orders, RFQs, supplier workspace, marketplace, and supplier portal.
- Architected a five-layer Playwright/TypeScript framework (fixtures, 14 page objects, 11 component objects, 16 API helpers, constants modules) and enforced strict Page Object Model with an ESLint rule that errors on raw locators in specs.
- Added `data-pid` selector attributes to the React application across 73 commits, centralised as constants in both codebases, eliminating text-selector breakage under the French locale.
- Owned the `.gitlab-ci.yml` end to end (4 stages, ~14 jobs). Cut the merge-request gate from 15.4 to 3.7 minutes by splitting one job into six domain-scoped jobs, and the nightly run from 25.4 to 19.2 minutes via test-selection inversion and shard parallelism, throttled to avoid timeouts on the shared environment.
- Wired result publishing: JUnit into GitLab, HTML reports to GitLab Pages, and a Node integration that creates a TestRail run per pipeline, posts pass/fail per case, and links back to the CI job. Mapped 357 TestRail cases to automated specs.
- Built a typed API client with token auth, per-worker login caching, automatic re-authentication on mid-run 401s, and opt-in retries that prevent duplicate writes. API-seeded test data cut ~40 seconds of UI setup to ~2 seconds per test. Authored pure-API permission suites verifying server-side 403/200 enforcement.
- Found that a green pipeline was not running tests (1 of 7 passed, the rest self-skipped on missing credentials). Shipped a guard that fails any job that passes nothing and fixed the credential gap, so eight dark tests began executing.
- Traced a suspected flaky pagination test to a real product regression on a server-paginated grid and filed it with evidence. Shipped ~30 merge requests across both repositories.

Senior Automation Engineer

Loanworks Inc. — Ortigas City, Philippines *November 2020 – October 2023* Regulated financial services (loans and mortgages)

- Migrated a legacy automation framework to Cucumber BDD, improving maintainability across loan origination and mortgage servicing workflows.
- Developed and maintained automated regression scripts for a business-critical financial services platform.
- Assessed defects, compiled findings, and proposed resolutions to development teams; partnered with developers and project managers to shape test plans for upcoming releases.

Test Engineer

Accenture Inc. — Mandaluyong City, Philippines *January 2018 – October 2020*

- Developed Selenium WebDriver regression automation for an enterprise product line, migrated it to Cucumber BDD, and integrated it with Jenkins CI to enable continuous testing.
- Produced daily, weekly, and monthly suite-stability reports for stakeholders; applied performance testing with LoadRunner and UFT; documented framework usage to speed up onboarding.

SELECTED AI & AUTOMATION PROJECTS

Personal Inbox Agent — *Python · Gmail API · Ollama · SQLite* · github.com/noobcat0418/inbox-agent

- Reads new Gmail and older mail through a resumable backfill; a local model sorts each email into important, to-do, FYI, or noise, so mail never leaves the machine. Writes a daily summary and a to-do list with due dates.

- All Gmail writes go through one module that refuses any label outside `AI/`; it never archives, deletes, or sends. Treats every email as untrusted input (prompt-injection delimiters, category allow-list). 26 automated tests.

Fashion Scraper & AI Shopping Board — *Python · SQLite · Ollama* · github.com/noobcat0418/fashion-scraper

- Turns public Shopify feeds into one row per colourway with price history, a filterable board, and a CSV. A local LLM rates each product on four criteria; weights live in config and are applied in code. Polite by design: robots.txt checks, request spacing, caching, rate-limit backoff. 26 tests.

AI Activity-Digest Agent — *Python · Claude · GitLab, Jira & TestRail APIs · Discord webhooks*

- Pulls activity from three platforms into one record model, filters it for relevance, and summarises it with Claude into a markdown report and Discord post. A measured run kept 107 of 458 records; grouping review comments cut the LLM payload from ~70k to ~46k tokens.

EDUCATION, TRAINING & INDUSTRY EXPOSURE

Bachelor of Science in Information Technology — Pamantasan ng Lungsod ng Muntinlupa

Accenture training: Automation Testing (Java), Manual Testing, Performance Testing (LoadRunner / UFT), Agile Testing

Industries: Australian enterprise case management (aged care and allied health), B2B manufacturing procurement, regulated financial services, healthcare, document management, online gaming, enterprise SaaS
